

[Biotech Snapgene Crack](#)

The screenshot displays the SnapGene software interface. The main window shows a circular plasmid map for 'pQE-60NA-EGFP' (4144 bp). The map includes various features such as 'Ampicillin promoter', 'T5 promoter', 'EGFP', 'lambda 10 termin...', and 'rmb T1 terminator'. Numerous restriction enzyme sites are marked around the circle, including XmnI, BsaHI, PvuI, FspI, AseI, BglI, BsaI, AhdI, AlwNI, PspFI, BseVI, EcoRI, BamHI, AgeI, BsrGI, EagI, NotI, HindIII, BspI, NheI, BmtI, PvuII, BspEI, PstI, PflMI, PmlCI, BfrBI, NsiI, and XbaI.

Below the map, a workflow diagram shows the linearization of the 'Vector' (3403 bp) using BamHI (121) and NotI (128) enzymes, followed by the insertion of an 'Insert' (741 bp) using BamHI (78) and NotI (819) enzymes, resulting in a 'Product' (4144 bp). The product name is 'pQE-60NA-EGFP.dna'. A green box indicates 'Ready to done Product: 4144 bp'. The interface also shows a 'Bacterial Transformation Strain' dropdown set to 'DH5a' and a 'Product Name' field containing 'pQE-60NA-EGFP.dna'.
